Installation - PC

To install on a PC system, first download the file from the Downloads page on the RJM Music website. Before downloading, make sure the correct product type is selected in the bar above the list of releases.

> *Important note: The editor version needs to match the first two numbers of your product's firmware version. For example, If you have firmware version 4.6.1, the editor needs to be version 4.6.x. In general, it's best to have the latest firmware and editor version. Your Mastermind's firmware version is displayed in bottom right corner of the main LCD display for 2 seconds on power up.*

Double-click the .zip file that was downloaded, and it will open up a window showing the editor MSI (installer) file. On some systems, the .zip file will automatically be extracted, in which case you will already have a MSI installer file. Double click this file to start the installation process. Follow the prompts to complete installation.

To run, go to the Start Menu and look for "MMGTEditor" or "MMEditor" under "All Programs" and select the editor app within that folder.
