

# Introduction

The Smart Multibox is a 2-input, 4-output MIDI interface with a microprocessor "brain". You can use custom scripts to filter, route and translate incoming MIDI messages and send them to any or all of the MIDI outputs.

Scripts are written in [Micropython](#), which is similar to Python 3, but is optimized for running on small devices. As of this writing, the Smart Multibox uses version 1.24.1 of Micropython.
